Jewelry Innovations®

Turning A Page – The Jewelry Innovations 2021 Collection

Welcome to our workshop, where skilled artisans combine classic bench jeweler techniques with the latest high-tech methods, materials and equipment to create this collection of contemporary and classic styles. In these pages you will find jewelry made from the finest metals, including Serinium®– the Precious Contemporary Metal®, Black Diamond Ceramic™, and Rugged Tungsten™.

Whether you prefer the natural warmth of solid oak inlay in our Barrel Aged™ collection of rings, the pure high-tech look of carbon fiber, the classic gleam of 14K gold inlay or one of the hundreds of laser engravings from our design portfolio, you can count on the quality and industry-leading customer service you've come to expect from Jewelry Innovations.

Thank you for letting us serve you since 1989.

BARREL
AGED™

The Barrel Aged™ Collection

The Barrel Aged collection from Jewelry Innovations features solid wood inlays from authentic whiskey, wine and cognac barrels. Hand crafted by our skilled jewelers, these beautiful bands can be customized to the needs of your clientele, and can even be inlaid with barrel wood from specific brands of whiskey upon request. Available in Serinium® – The Precious Contemporary Metal®, Rugged Tungsten™ and Black Diamond Ceramic™.

The Serinium® Story

In the late 1990s, we had an idea for something completely new to the jewelry industry. We wanted to develop what we called “the perfect contemporary jewelry metal”. Despite the popularity of metals such as tungsten carbide, titanium and cobalt chromium, there were significant downsides to all of them and major safety concerns. Donny McIllece, our VP of Product Development, thought we could do better.

After years of development in numerous labs, in 2011 Jewelry Innovations filed its patent application for the fine jewelry metal that would come to be called Serinium. Serinium combines the best properties of existing metals without any of the drawbacks. It is extremely hard and wear resistant, like tungsten carbide, but not as brittle. It has a beautiful, white color like cobalt and will not oxidize, tarnish or change color over time, but unlike cobalt and titanium it will not crush onto a finger and can quickly and safely be removed in an emergency. It is hypoallergenic, and can stand extremes of heat and impact without damage.

For all of these reasons, we call Serinium “The Precious Contemporary Metal”. All of our collections, including those in this catalog such as Barrel Aged and Royal Copper, and all of our laser engravings, are available in this finest of all contemporary jewelry metals.

For its unique combination of hardness, beauty and safety, in 2016 Serinium was awarded U.S. Patent No. 9,289,037.

Cultural Heritage Collection

Our Cultural Heritage collection celebrates the rich cultural heritage of America. We offer a wide selection of religious themed designs as well as classic ancestral patterns such as the Viking, Aztec and Dublin Rose. Custom patterns can also be made. All rings are available in Serinium®, Black Diamond Ceramic™, Rugged Tungsten™, and our other fine metals.

Precious Metal Inlays

Our skilled jewelers blend the traditional beauty of gold, sterling silver or platinum with the current look of high tech contemporary metal to create our precious metal inlay collection. These rings are not plated – each ring is inlaid with a solid band of precious metal. The collection includes a wide range of styles and widths, in Serinium®, Black Diamond Ceramic™, Rugged Tungsten™ and Aerospace Grade Titanium™.

Serinium®

Serinium is the most beautiful of all contemporary fine jewelry metals, with the brilliant color of white gold. Forged at extreme temperatures and pressures, this high-tech material is ultra-hard, hypoallergenic, and will never tarnish, oxidize or change color. Serinium is also the safest of jewelry metals, and can be quickly and safely removed in an emergency. In recognition of its unique properties, Serinium was granted patent number 9,289,037 by the U.S. Patent Office. Offered in whole and half sizes 5–16, widths 4mm, 6mm, 8mm and 10mm (Serinium square rings are 9mm in width).

Black Diamond Ceramic™

Black Diamond Ceramic is among the hardest materials in the world. Elegant and sophisticated, it is only half the weight of tungsten carbide and its black color is solid throughout, not a coating that can scratch and wear. Perfect for someone who wants the classic look of black in a contemporary ring. Offered in whole and half sizes 4–16, 6mm & 8mm widths.

Aerospace Grade Titanium™

Strong, flexible, and light weight, Titanium is the material of choice for many contemporary rings. But not all Titanium is created equal. Our Aerospace Grade Titanium is 90% pure, the same quality standard required by the aerospace industry for the most demanding applications, and is the highest quality Titanium available in the jewelry industry. For the value conscious customer, many of our rings are also available in our Quality Standard Titanium™. Aerospace Grade Titanium is offered in sizes 2–20 and 2mm–12mm widths. Quality Standard Titanium is offered in sizes 8–12 and widths shown.

Understanding Contemporary Fine Jewelry Metals

A Brief Description of the Different Metals and Their Properties

Serinium®

Serinium, the Precious Contemporary Metal®, is a trademark for the newest and most beautiful of the contemporary fine jewelry metals. This metal is patented and exclusive to Jewelry Innovations. Similar in color to white gold, Serinium is ultra tough, hard and scratch resistant. It is many times harder than other jewelry metals, second only to tungsten carbide, which is far more brittle. Unlike tungsten carbide, Serinium will not chip or shatter if dropped on a hard surface and will not tarnish, oxidize or change color. Serinium will not crush onto a finger, and is easily and safely removed in emergencies by applying pressure with hand held vise grips. It will not bend in the removal process and breaks off cleanly in 2-3 pieces with no sharp edges. Serinium is also hypoallergenic.

Black Diamond Ceramic™

Black Diamond Ceramic is a brand of high tech ceramic compound that is extremely hard and light weight, resulting in a beautiful and enduring ring. Black Diamond Ceramic is very scratch resistant, can be made in many colors and is colored throughout, so it will not show the effects of wear even if scratched or worn. This material can be carved and engraved with a high power laser and can be removed with vice grip pliers in an emergency.

Rugged Tungsten™

Rugged Tungsten is an exclusive brand of high-quality tungsten carbide jewelry alloy. It has been uniquely formulated to resist breakage, tarnishing and oxidization. The hardest of the contemporary metals, tungsten carbide is also very heavy and has an attractive grey color which tends to oxidize and darken somewhat over time. Tungsten carbide is subject to chipping and breakage if dropped but will not crush onto a finger. It can be removed in an emergency with vice grip pliers, but unlike Serinium it can produce sharp pieces when broken. Tungsten carbide is too hard to cut with easily available tools, but it can be carved and engraved with a laser.

Aerospace Grade Titanium™

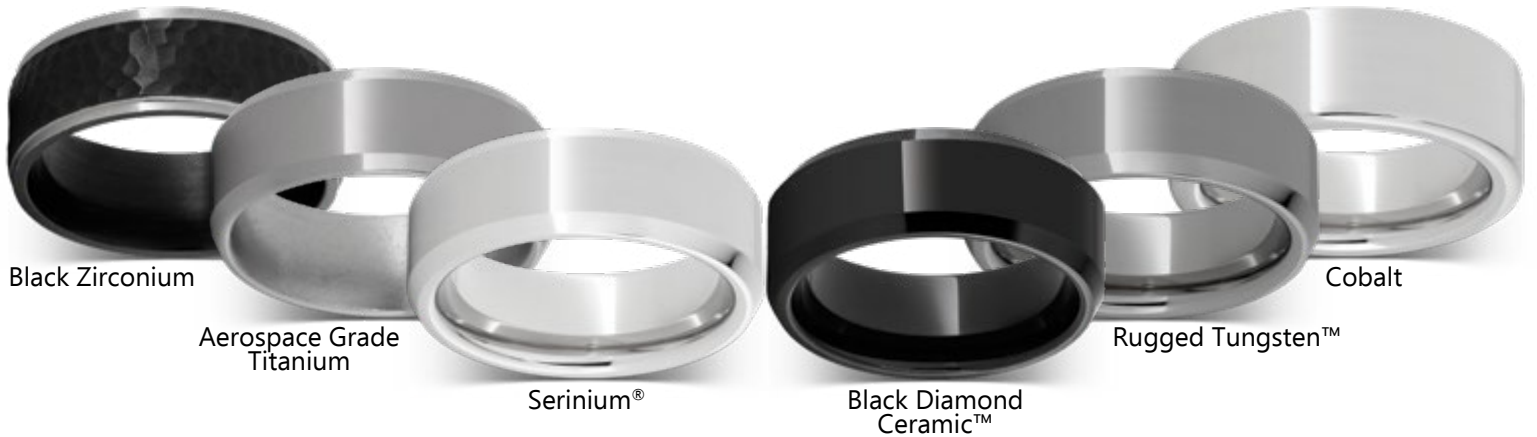
Aerospace Grade Titanium and its value priced alternative, Quality Standard Titanium™, are branded alloys of titanium, an extremely tough, flexible, light weight and durable metal used primarily in aerospace and industrial applications. Titanium is light grey in color and not as hard as Serinium or tungsten carbide, but harder than gold. Higher grades of titanium such as Aerospace Grade Titanium are harder to work but create stronger, harder and more durable jewelry. Titanium rings can be difficult to remove in an emergency as they will crush onto a finger and must be cut in at least two places with diamond edged tools, generating significant heat, in order to be removed.

Zirconium

Zirconium, periodic table symbol Zr and atomic number 40, is a grey metal that is relatively soft and ductile. Because it has a high melting point it can be colored on the outside by heat treatment, as with Black Zirconium, and shaped or carved either by milling or laser engraving. It is subject to oxidation, and will crush onto a finger but can be removed in an emergency with proper cutting tools.

Cobalt

Cobalt jewelry is actually made from an alloy of cobalt, chromium and molybdenum. Its color is similar to white gold. Cobalt is hypoallergenic and a primary use of this alloy is medical devices such as artificial joints. Because of its toughness and flexibility, cobalt jewelry will crush onto a finger and is extremely difficult to remove in an emergency. Removal requires a trained professional using diamond edged cutting tools to make at least two cuts through the ring, which generally takes 10 – 20 minutes and generates very significant levels of heat.



Finishes

Most finishes are available on any style ring. Pictured are examples of finishes on Serinium® bands, with the associated style numbers.
